

## **Dr. Andrew Snelling Lectures**

“A Global Flood of Noah: A Geological Defense” (Saturday, June 15, 9:15-10:30 a.m.)

If the global Flood as described in Scripture occurred, what evidence would be expect to find today? Evidence that the oceans covered the continents, graveyards of exquisitely and rapidly preserved fossils, sediment layers spread right across and even between continents, evidence that each of the fossil-bearing layers formed rapidly, and evidence that they formed rapidly one after the other, and not over millions of years. Clear and powerful examples of these evidences are presented to show that the biblical Flood is confirmed as a real historical event that occurred in just over a calendar year, thus eliminating the secular geological timescale of millions and billions of years.

“How Reliable are the Rock Dating Methods?” (Saturday, June 15, 3:15-4:45 p.m.)

All dating methods involve three unproven and unprovable assumptions. In the context of the radiometric methods now routinely used to date rocks there are copious examples in the scientific literature that demonstrate these assumptions are routinely violated, rendering these methods as incapable of providing the absolute vast ages so dogmatically asserted. Yet because radiocarbon decays within tens of thousands of years its presence still today in fossils, rocks, coal, oil and even diamonds, as also openly documented in the scientific literature, indicate all these are of very recent origin and the earth is thus only thousands of years old.
